                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                               180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300
which is characterised by two inverted terminal repeats (ITR) and open reading frames for rep and capsid (cap) proteins. The rep reading frame encodes four proteins, Rep 78, Rep 68, Rep 52 and Rep 40, while the cap reading frame encodes three structural proteins, VP1, VP2 and VB3. The AAV-1 sequence or its fragments particularly ITRs, rep and cap coding regions, are useful in production of recombinant viral vectors for gene delivery. These vectors can be used as gene therapy vectors, vaccine vectors or antisense delivery vectors. The AAV-1 does not induce the formation of neutralising antibodies specific to any serotype of AAV mace is useful for transforming host cells, and in the preparation of a medicament for the delivery of transgene to a host. The present sequence is an AAV-1 DNA encoding a cap protein VP3 which is useful in the production of recombinant viral vector for gene delivery

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              495
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             555
                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses an adeno-associated virus serotype 1 (AAV-1) DNA which is characterised by two inverted terminal repeats (ITR) and open reading frames for rep and capsid (cap) proteins. The rep reading frame encodes four proteins, Rep 78, Rep 68, Rep 52 and Rep 40, while the cap reading frame encodes three structural proteins, VP1, VP2 and VP3. The AAV-1 sequence or its fragments particularly ITRs, rep and cap coding regions, are useful in production of recombinant viral vectors for gene delivery. These vectors can be used as gene therapy vectors, vaccine vectors or antisense delivery vectors. The AAV-1 does not induce the formation of neutralising antibodies specific to any serotype of AAV hence is useful for transforming host cells, and in the preparation of a medicament for the delivery of transgene to a host. The present sequence is an AAV-1 DNA encoding a cap protein VP2 which is useful in the production of recombinant viral vector for gene delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AGCACCCGCACCTGGGCCTTGCCCACCTACAATAACCACCTCTACAAGCAAATCTCCAGT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses an adeno-associated virus serotype 1 (AAV-1) DNA which is characterised by two inverted terminal repeats (ITR) and open reading frames for rep and capsid (cap) proteins. The rep reading frame encodes four proteins, Rep 78, Rep 68, Rep 52 and Rep 40, while the cap reading frame encodes three structural proteins, VP1, VP2 and VP3. The AAV-1 sequence or its fragments particularly ITRs, rep and cap coding regions, are useful in production of recombinant viral vectors for gene continuous transfers of the sectors or antisense delivery vectors. The AAV-1 does not induce the formation of neutralising antibodies specific to any serotype of AAV hence is useful for transforming host cells, and in the preparation of medicament for the delivery of transgene to a host. The present sequence is an AAV-1 DNA encoding a cap protein VP1 which is useful in the production of recombinant viral vector for gene delivery

The invention relates to an adeno-associated virus (AAV) clade comprising at least three AAV members, where each member of the AAV clade is phylogenetically related as determined using a Neighbor-Joining heuristic by a bootstrap value of at least 75 % per 1000 isolates and a Polsson correction distance measurement of no more than 0.05. The methods and compositions of the present invention are useful for the prevention and/or treatment of fheumatoid arthritis, multiple sclerosis, asarcoidosis, diabetes, scleroderma, psoriasis, vasculitis, Crohn's disease, hemophilia, HIV, bacterial infection, cancer and ulcerative colitis. The present sequence represents an adeno-associated virus DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              840

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             967 GAGGICACGACGAAIGAIGGIGICACAACCAICGCIAAIAACCITACCAGCACGGIICAA 1026
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an adeno-associated virus (AAV) clade comprising at least three AAV members, where each member of the AAV clade is phylogenetically related as determined using a Neighbor-Joining heuristic by a bootstrap value of at least 75 % per 1000 isolates and a Poisson correction distance measurement of no more than 0.05. The methods and compositions of the present invention are useful for the prevention and/or treatment of rheumatoid arthritis, multiple sclerosis, arcoldosis, diabetes, scleroderma, psorialisis, vasculitis, Crohn's disease, hemophilia, HIV, bacterial infection, cancer and ulcerative colitis. The present sequence represents an adeno-associated virus DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel recombinant herpes simplex virus (rHSVS) whose genome is respectively inserted by the Adeno-associated virus (AAV) rep gene and cap gene. The AVV genes may be derived from viruses AAVI, AAV2, AAV3, AAV4, AAV5 and AAV6. The methods of the invention may be useful for generating recombinant vectors with high efficiency and no need of reconfiguration. The current sequence is that of the Adeno-associated virus 2 (AAV2) rep-Adeno-associated virus 1 (AAV1) cap fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2867 TTTGATTTCAACAGATTCCACTGCCACTTTTCACCACGTGACTGGCAGCGAGCTCATCAAC

The invention relates to a recombinant herpes simplex virus (HSV)

Characterized in that its genome is inserted with a DNA sequence selected

Characterized in that its genome is inserted with a DNA sequence selected

from nucleotide sequences of ADZ46594 or their homologous

sequences. Also included are preparing the recombinant HSV (comprising

the construction of DNA fragments that contains sequences ADZ46594.

MDZ46599, and respectively inserting these 5 DNA fragments into genome of

HSV by applying genetic engineering to give the recombinant HSV), large-

scale production of 5 serotype recombinant adeno-associated viruses (AAV)

1, 3, 4, 5, and 6 (by preparing the recombinant HSV, establishing a one-

scream vector cell i.e. recombinant AAV vector cell-line, infecting the

corresponding vector cell-line with the 5 recombinant HSV in

recombinant AAV under the infective effect of the 5 recombinant HSV in

Che vector cell-line, separating and purifying the 5 serotype recombinant

AAV after lysing the AAV-containing cells and culture liquor to give a

crude lysate and further purification of rAAV by density-gradient

centrifugation or affinity chromatography) and a recombinant vector

Champing passing the AAV-containing ITR at both ends of AAV-1, AAV-3, AAV-4, AAV

containing the AAV-searly enhancer and promoter of

cytomegalovirus, and a polyclonal site and a polyA signal, respectively,

between the ITR (inverted terminal repeat), and neomycin-resistance gene-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 900
       into Xbal site in UL2 or UL44 gene in HSV genome. The DNA sequence of sequence ADZ46594-ADZ46598 can also be inserted into other non-essential gene regions in HSV genome. The recombinant HSV is optionally inserted with other DNA sequences homologous with the already-specified fragments. The vectors are for use in gene therapy of e.g. cancer, respiratory diseases and neural diseases. The virus vectors are safe, with long expression time and wide-spectrum of cell infection, even non-cleaved cells and reverse axonal conduction through the incorporated HSV vectors, and high transfer efficiently. The present sequence is the HSV-AAV sequence rep2cap1 for the AAV/HSV vectors of the invention.
expressing cassette at outer edge of ITR). The DNA sequence is inserted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an adeno-associated virus serotype 1 (AAV-1) DNA characterised by two inverted terminal repeats (ITR) and open reading frames for rep and capsid (cap) proteins. The rep reading frame encodes four proteins, Rep 78, Rep 68, Rep 52 and Rep 40, while the cap reading frame encodes three structural proteins, VP1, VP2 and VP3. The AAV-1 sequence or its fragments particularly ITRs, rep and cap coding regions, are useful in production of recombinant viral vectors for gene delivery. These vectors can be used as gene therapy vectors, vaccine vectors or antisense delivery vectors. The AAV-1 does not induce the formation of neutralising antibodies specific to any serotype of AAV hence is useful for transforming host cells, and in the preparation of a medicament for the delivery of transgene to a host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

The invention relates to a novel method for detecting adeno-associated virus (AAV) sequences in a sample, which comprises subjecting a sample containing a DNA to amplification via a polymerase chain reaction (PCR). The AAV sequence have the following activities: cytostatic, antithermatic, antithermic, antithermic, antithermic, antithermic, antithermic, antithermic, antithermic, antithermic, and antinflammatory. The AAV sequence can be used in gene therapy or as part of a vaccine to treat disorders. The method is useful in detecting and/or identifying AAV sequences may be used e.g. for preventing or treating hyperproliferative conditions such as cancers and psoriasis, and other autoimmune diseases like rheumatoid arthritis, multiple sclerosis, diabetes, autoimmune thyroiditis, scleroderma or Crohn's disease. This polynucleotide sequence therefores and AAV related DNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                              adeno-associated virus, AAV; cytostatic; antipsoriatic; antirheumatic; antiarthritic; neuroprotective; antidiabelic; antithyroid; dermatological; antiinflammatory; gene therapy; vaccine; hyperproliferative; cancer; psoriasis; autoimmune disease; rheumatoid arthritis; multiple sclerosis; diabetes; autoimmune thyroiditis; scleroderma; Crohn's disease; gene; ds.

Disclosure; SEQ ID NO 3; 62pp; English

The invention relates to an expression construct comprising a nucleic acid sequence encoding an adeno-associated virus integration efficiency element (AAV IEE), which is devoid of AAV inverted terminal repeats (AAV IRE) and site-specifically integrates into a host cell chromosome when provided to the host cell in conjunction with an AAV Rep protein. The cypression construct can be used as a therapeutic factor for treating a mammal for a pathologic state which is cancer, including lung cancer, colon cancer, renal cancer, panal cancer, including lung cancer, cancer, bone cancer, barain cancer, bile duct cancer, bladder cancer, gastrointestinal cancer, laryngeal cancer, cervical cancer, gastrointestinal cancer, laryngeal cancer, prostatic cancer, retinoblastoma, ovarian cancer, prostatic cancer, thymus cancer thyroid cancer. Other pathologic state includes inflammatory disease (arthritis), neurodegenerative decreased a disease of an organ attributed to the presence of increased or decreased level of a particular gene product(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a polynucleotide (1), comprising
rep coding sequences and parvovirus cap coding sequences. The
rep coding sequences encodes a DNA binding domain from a first ferent
parvovirus, and a capsid interacting domain from a parvovirus different
from the first parvovirus. The cap coding sequence comprises sequences
from the different parvovirus. Also described: (1) a vector comprising
(1), (2) a cell comprising (1), or parvovirus rep coding sequences and
parvovirus cap coding sequences, where the rep coding sequences encode a

produced from pFBDAAV1-VP for use in the production of recombinant AAV particles comprising AAV1 capsid proteins in insect (Sf9) cells. The method of producing AAV in insect cells provides an efficient, safe and economical means of producing a large amount of recombinant AAV particles which may be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   crecercecricededededericardaricededariacecriaecree

The modified VP gene has the VP1 initiation codon mutated to ACG to reduce its translation efficiency. An out-of-frame ATG, which diminishes the translation of VP2 and VP3, is also modified, and the splice acceptor site downstream of the VP1 initiation codon has been destroyed. Recombinant baculovirus vectors comprising the mutant AAV1 VP gene were
